

Parasocial

● Live on Base + Solana · Real onchain txs

Parasocial.

Copy smart money onchain.

After you know who's actually smart.

Copy trading is a billion-dollar market.

Banana Gun does roughly \$4B/year in volume. Maestro and Unibot, similar. But none answer the only question that matters:

Which wallets do you actually trust?

THE FAILURE MODE

Most “smart money” feeds surface whoever's loudest — not whoever's right. Leaderboards reward visibility, not realized PnL.

A credibility score before you ape.

CREDIBILITY SCORE

Scored, not ranked.

Realized PnL, overall win rate, asset-specific win rate, recency. Auto-flags dust-inflated wallets.

ONE-TAP MIRROR

Watch, alert, tap.

Poller catches every trade from a watched wallet. You get a scored alert and a single button. Swap settles in roughly 15 seconds.

DCA ON RAILS

Auto-buy on a schedule.

/dca ETH 5 hourly base. Runs on a 30-second scheduler. Persists. Every tick hits the same policy gate.

Four steps from message to onchain tx.

01

Generate wallets

/wallet auto-creates an EVM key and a Solana keypair. AES-256-GCM encrypted, script-derived per-user.

02

Fund the address

Send USDC (and a little gas) to the deposit address. /balance confirms.

03

Watch or DCA

/watch 0x... for copy-trading. /dca ETH 5 hourly base for scheduled buys. Policies apply to both.

04

Sign & broadcast

Bot quotes Zerion /swap/offers, signs with viem (EVM) or ed25519 (Solana), broadcasts. Real tx hash.

From Telegram message to confirmed tx in roughly 15 seconds.

Realized PnL is the honest signal.

Vitalik.eth shows -99% total PnL — his wallet is polluted by ENS names and received airdrops inflating total-invested.

Our score auto-detects this and falls back to realized PnL only: +10.3%. That's the number a copy-trader actually needs.

FORMULA

```
score = 0.4 · realized_pnl_norm  
       + 0.3 · overall_win_rate  
       + 0.2 · asset_win_rate  
       + 0.1 · recency
```

TIERS

≥75 Hot hand ≥50 Diamond hands ≥25 Mixed bag <25 Bag holder

Every swap, every tick, gated.

Mirror taps and DCA ticks funnel through one `checkPolicy()` call. No bypass. No god-mode agent.

Max \$ per trade	\$50
Daily spend limit	\$200
Allowed chains	ethereum, base, solana
Slippage cap	0.5%
Cooldown between trades	30 min
Auto-mirror	off by default

Rejections surface with a clear reason in the audit log. The schedule keeps running.

One primitive. Every path funnels through it.

SURFACE

Telegram → grammy runner (concurrent handlers)

TRIGGERS

/wallet · /watch · /dca · Mirror tap · /balance

SHARED PRIMITIVE

buyAssetWithUsdc()

balance check → Zerion /swap/offers → approve USDC → sign (viem or ed25519) → broadcast

HOW IT CONNECTS

Zerion REST for swap offers, pnl, and history. Zerion CLI kept only for history polling. viem + @solana/web3.js handle signing locally on a per-user key.

Where we extended Zerion CLI.

FROM ZERION CLI

Swap routing

/swap/offers endpoint for quotes and transactions

Wallet analysis

history, pnl, portfolio, positions

Solana tx format

versioned + legacy deserialization reference

WE ADDED

Per-user custodial wallets

EVM + Solana, AES-256-GCM + script per-user

Credibility scoring engine

realized PnL, win rate, asset win rate, recency

Telegram interface

grammy + runner for concurrent handlers

DCA scheduler

30-second tick, persisted in SQLite

Scoped policy engine

six caps, one checkPolicy() gate

Unified buyAssetWithUsdc()

one primitive for mirror + DCA + future

Telegram bots need unattended wallet generation per user. The CLI's interactive wallet create wasn't bot-shaped. Full friction log in repo.

Live bot — @FrankRealBot.

Telegram demo running 24/7 on Railway with a persistent SQLite volume. Code open-source. Real onchain txs confirmed on Basescan and Solscan.
